

What hazards do volcanoes present?

1. Use the internet to help you to briefly describe the following volcanic hazards:
lava flows, ash fall, lahar, pyroclastic flow
2. Find two other hazards associated with some volcanic eruptions and add these to your list (with brief descriptions!)
3. Volcanic hazards are called **primary hazards** if they are caused directly by/during the eruption – and **secondary hazards** if they occur some time after the eruption.
 - i. Sort your hazards from tasks 1&2 into Primary and Secondary hazards.
 - ii. Choose one from each category and briefly explain why you have put it in this category.
 - iii. Suggest another way in which volcanic hazards could be classified. Why is your idea a useful way to describe different hazards?
4. Which type of hazard do you think could have the biggest impact on people? Justify your choice.
